PROFILE

Biomimicry-driven biomedical engineer building AI-enabled systems across medical imaging, robotics, biosensing, and implantable therapeutics. I translate biological principles and clinical problems into computational and physical systems, with experience in deep learning, computer vision, multimodal sensing, embedded control, and end-to-end prototyping.

EDUCATION

Georgia Institute of Technology - B.S. Biomedical Engineering, Minor in AI/ML | GPA: 3.92 | Graduation: Spring 2028
Courses: Biomed ML, Health Wearables/Instrumentation, System Optimization, Computational Biology, Medical Devices

EXPERIENCE

- Solutions Consulting & Engineering Intern** May 2026 – Present
World Wide Technology
- Enterprise security and post-quantum cryptography consulting for Fortune 500 healthcare/medical-device companies
- Biotech Startup Consultant** August 2026 – Present
Bioconnect @ Georgia Tech (BCGT)
- Supporting Cambium Oncology with biotech startup strategy and VC/investor readiness
- Drug Delivery Systems Researcher** January 2026 – Present
Abramson Lab, Georgia Tech
- Fabricated and tested 200+ implantable drug-delivery capsules, integrating fluid delivery and biosignal circuitry
 - Performed H&E and Masson's trichrome histology to evaluate fibrotic foreign-body response around chronic implants
- Biomimicry Robotics Researcher** June 2025 – May 2026
Bhamla Lab, Georgia Tech
- Translated mudskipper locomotion and biological kinematics into an amphibious, water-hopping robot ([APS 2026](#))
 - Fabricated and tested DARPA-backed flexible squid-inspired jet nozzles to improve underwater propulsion efficiency
- Neuromorphic Engineering Researcher** June 2025 – August 2025
Raman Lab, Washington University in St. Louis
- Built an automated system to study locust olfaction for artificial sensing; increased experimental throughput by 200%
- AI/ML Cancer Pathology Intern** August 2024 – May 2025
Madabhushi Lab, Emory University
- Built deep learning/computer vision pipeline for ER+ breast cancer prognosis across 10,000+ histopathology WSIs

PROJECTS

- Foveate – Bio-Inspired Computational Pathology - Independent Research**
- Developing a bio-inspired saccadic attention framework for gigapixel pathology to test whether selective WSI sampling improves diagnostic accuracy, not just efficiency, per unit compute over uniform sampling
 - Built and validated a reproducible CAMELYON16 pipeline with Virchow2/NVIDIA MONAI, physical-scale WSI sampling, matched compute budgets, leakage safeguards, deterministic GPU evaluation, and 100+ regression tests
- 4sight - 2nd Place Cloudflare Track at TreeHacks 2026**
- Built a multimodal wearable ML pipeline using HRV, motion, stress, sleep, and visual contextual signals to estimate near-term fatigue, decision-making, and physiological vulnerability and trigger adaptive interventions
 - Designing a v2 study** of personalized physiological-state forecasting, cross-user adaptation, missing-sensor robustness, and compute-constrained inference
- MedGraph - 1st Place Data Science at HooHacks 2025**
- Built a privacy-preserving federated GNN for bias-aware disease prediction across decentralized hospital EHR data

OTHER: YC Startup School 2026, APS Global Summit 2026 ([presented bio-physics research](#)), BlueDot AIxBiosecurity

SKILLS

Biomedical & Computational: Medical imaging, computer vision, computational biology, biomechanics, biophysics, biosensing, health wearables, medical robotics

ML: Python, MATLAB, PyTorch, TensorFlow, NumPy, OpenCV, computer vision, neural networks, federated learning

Hardware & Systems: microcontrollers, cameras/sensors, embedded control, CAD/Fusion 360, rapid prototyping, hardware-software integration, soldering, closed-loop sensing & control, Flask, REST APIs, AWS, GCP, Cloudflare
