PROFILE

Biomedical engineer with a biomimicry foundation working across robotics, bio-sensing, implantable systems, and AI/ML. I study how complex living systems solve problems, then translate those principles into whatever the problem demands — hardware, software, or systems that don't exist yet.

EDUCATION

Georgia Institute of Technology - B.S. Biomedical Engineering, Minor in AI/ML

GPA: 3.92 | Expected Graduation May 2027

EXPERIENCE

Solutions Consulting & Engineering Intern

May 2026 – Present

World Wide Technology

Drug Delivery Systems Researcher

Abramson Lab, Georgia Tech

January 2026 – Present

- Developing implantable, closed-loop drug delivery capsules for autonomous opioid overdose reversal
- Building novel microscale sensing and therapeutic control system architecture for long-term implantation

Biomimicry Robotics Researcher

Bhamla Lab, Georgia Tech

June 2025 – May 2026

- Designed a bio-inspired amphibious robot for cross-terrain movement, informed by mudskipper hopping locomotion
- Developed DARPA-backed squid-inspired jet nozzles to improve underwater propulsion efficiency

Neuromorphic Engineering Researcher

Raman Lab, Washington University in St. Louis

June 2025 – August 2025

- Created the first automated locust behavioral rig (GitHub: POR-Behavioral-Rig) for artificial sensing systems
- Integrated microcontrollers, olfactometers, and real-time tracking – increased experiment efficiency by over 200%

AI/ML Cancer Pathology Intern

Madabhushi Lab, Emory University

August 2024 – May 2025

- Built deep learning pipelines for ER+ breast cancer prognosis using over 10,000 histopathology WSIs
- Investigated and quantified collagen fiber orientation disorder (CFOD) as a metastasis biomarker

CISO Cybersecurity Intern

Netskope

May 2024 – August 2024

- Automated AWS/GCP S3 vulnerability detection and DNS monitoring tools; authored SOC triage documentation

PROJECTS

4sight - 2nd Place Cloudflare Track at TreeHacks 2026 (<https://devpost.com/software/4sight-neoslb>)

- Built ML model predicting decision-impairment from wearable biometric data (HRV, motion, stress indicators)
- Integrated custom-built smartwatch and visual Ray-Ban Meta signals into real-time adaptive feedback
- Designed end-to-end hardware–software pipeline with user-facing interventions to improve decision making

MedGraph - 1st Place Data Science at HooHacks 2025 (<https://devpost.com/software/medgraph>)

- Built federated learning framework trained on multi-hospital EHR data
- Designed a secure, bias-aware patient outcome prediction model

Period Futures President – Wish4WASH/Engineers Without Borders

- Led 12+ stakeholder interviews; publication in preparation on menstrual health stigma and equity

CONFERENCES/EVENTS: YC Startup School 2026, APS Global Conference 2026 (presented bio-physics research)

TECHNICAL SKILLS

Bio-Inspired & Robotic Systems: Biomechanical modeling, closed-loop sensing & control, locomotion and propulsion system design, bio-compatible circuits

Machine Learning & Computational Modeling: Computational biology, Python, PyTorch, TensorFlow, computer vision, neural networks, federated learning

Hardware & Embedded Systems: Raspberry Pi, Arduino, sensor integration, MATLAB

Cloud & Backend Systems: AWS, GCP, Cloudflare, Modal, Flask APIs, MongoDB, Firebase
